

Vánky, K. 2006. The smut fungi (Ustilaginomycetes) of Restionaceae s. lat. – *Mycologia Balcanica* 3: 19-46.

Abstract. Smut fungi of Restionaceae s. lat. were studied. They are classified into two genera, *Restiosporium* and *Websdanea*. Problems of species delimitation in these smuts are discussed. In addition to the nine known smut fungi, thirteen new species are described and illustrated: *Restiosporium anarthriae*, *R. apodasmiae*, *R. chaetantheri*, *R. desmocladii*, *R. eurychordae*, *R. flexuosum*, *R. hypolaenae*, *R. lepyrodiae*, *R. pallentis*, *R. patei*, *R. proliferum*, *R. spathacei*, and *R. sphacelatum*.

Key words: new species, Restionaceae s. lat., *Restiosporium*, smut fungi, taxonomy, *Websdanea*
